

Database Management System – 44 (Physical Data Storage Organization)

Ajay James
Asst. Prof in CSE
Government Engineering College Thrissur

Outline

- Introduction
- Records
- Fixed length and variable length records
- Record blocking
- Spanned vs unspanned records
- Heap files
- Sorted files

Introduction

- Collection of data that makes up a computerized database must be stored physically on some computer **storage medium**
- Primary storage
- Secondary storage
- Tertiary storage

Records

- Record consists of a collection of related data values or items
- Value is formed of one or more bytes and corresponds to a particular field of the record
- Records describe entities and their attributes
- Example - EMPLOYEE record represents an employee entity
 - Name, Birth_date, Salary, or Supervisor.
- Data types – Numeric, String, Boolean, Date/time
- Binary large objects (BLOBs)
 - Unstructured objects

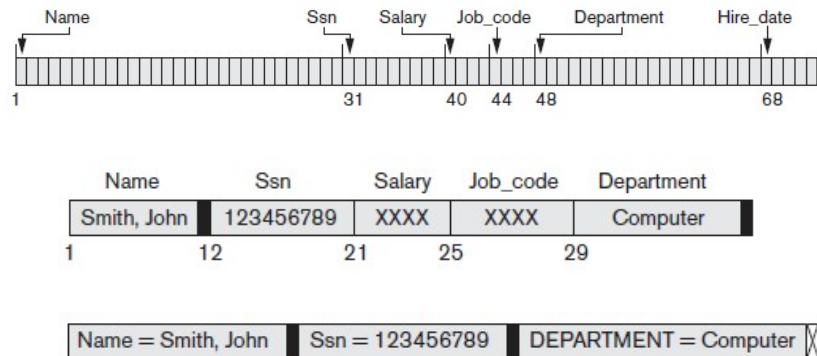

Files, Fixed-Length Records, and Variable-Length Records

- **File** is a sequence of records
- If every record in the file has exactly the same size (in bytes), the file is said to be made up of ***fixed-length records***
- If different records in the file have different sizes, the file is said to be made up of ***variable-length records***

Reasons for variable-length records

- One or more fields have variable length
- One or more fields are repeating
- One or more fields are optional
- File contains records of different types

Fixed and variable length records

Record Blocking

- Records of a file must be allocated to disk blocks
- When the block size is larger than the record size, each block will contain numerous records
- Block size is B bytes
- Fixed-length records of size R bytes, with $B \geq R$
- We can fit $bfr = \lfloor B/R \rfloor$ records per block
- Blocking factor**
- Unused space in each block = $B - (bfr * R)$ bytes
- number of blocks b needed for a file of r records:

$$b = \lceil r/bfr \rceil \text{ blocks}$$

Spanned Versus Unspanned Records

- Spanned records
 - Larger than a single block
 - Pointer at end of first block points to block containing remainder of record
- Unspanned
 - Records not allowed to cross block boundaries

Allocating File Blocks on Disk

- Contiguous allocation
- Linked allocation
- Indexed allocation

File Organization

- Refers to the organization of the data of a file into records, blocks, and access structures
- Includes the way records and blocks are placed on the storage medium and interlinked

Files of Unordered Records (Heap Files)

- Heap (or pile) file
 - Records placed in file in order of insertion
- Inserting a new record is very efficient
- Searching for a record requires linear search
- Deletion techniques
 - Rewrite the block
 - Use deletion marker

Files of Ordered Records (Sorted Files)

- Ordered (sequential) file
 - Records sorted by ordering field
 - Called ordering key if ordering field is a key field
- Advantages
 - Reading records in order of ordering key value is extremely efficient
 - Finding next record
 - Binary search technique

	Name	Ssn	Birth_date	Job	Salary	Sex
Block 1	Aaron, Ed					
	Abbott, Diane					
	Acosta, Marc					
Block 2	Adams, John					
	Adams, Robin					
	Akers, Jan					
Block 3	Alexander, Ed					
	Alfred, Bob					
	Allen, Sam					
Block 4	Allen, Troy					
	Anders, Keith					
	Anderson, Rob					
Block 5	Anderson, Zach					
	Angeli, Joe					
	Archer, Sue					
Block 6	Arnold, Mack					
	Arnold, Steven					
	Atkins, Timothy					
Block n-1	Wong, James					
	Wood, Donald					
	Woods, Manny					
Block n	Wright, Pam					
	Wyatt, Charles					
	Zimmer, Byron					

Sorted files

Average Access Times for Various File Organizations

Type of Organization	Access/Search Method	Average Blocks to Access a Specific Record
Heap (unordered)	Sequential scan (linear search)	$b/2$
Ordered	Sequential scan	$b/2$
Ordered	Binary search	$\log_2 b$
